SCREEN FOR BOLUS ENTRY

Getting to know the bolus entry screen

	Name	Description
①	Blood glucose result	If no current test result exists, --- is displayed.
②	Active Insulin	If no active insulin exists, --- is displayed. This screen element is only available with activated bolus advice feature.
③	Carbohydrate amount	If no carbohydrate amount is entered, --- is displayed.
④	Total amount	Tap this entry field to enter the total amount for the bolus. The total amount is the sum from correction bolus and meal bolus.
⑤	Correction insulin	Tap this entry field to enter the amount of insulin needed to return from an out-of-target blood glucose value back to values within target. Correction insulin can be negative, if the BG value is below the target value. This will be taken away from a pending meal bolus.
⑥	Meal insulin	Tap this entry field to enter the amount of insulin to compensate for the food ingested.
⑦	Bolus type	Tap this element to select one of the following bolus types: standard bolus, extended bolus, multiwave bolus, quick bolus, pen/syringe bolus.

The information displayed on the diabetes manager for the carbohydrate amount (③), is only visible if you have entered it in the detailed BG test result screen.

ⓘ **Note**

When the screen for bolus entry appears for the first time, there are no bolus amounts specified. You must enter the bolus amount.

If you first set the correction bolus or the meal bolus, the total bolus amount is deactivated and cannot be adjusted. The value, however, is updated accordingly.

If you first set the total amount, all insulin will be set as correction bolus. The entry fields for correction bolus and meal bolus are deactivated.

Therefore, it is recommended to start by entering correction bolus and meal bolus, seperately. Without bolus advice setup, distinguishing between correction and meal insulin mainly affects the bolus types you can use. With bolus advice set up, it may help to better control high BG values after meals.

STANDARD BOLUS

## What is the standard bolus

The standard bolus delivers the programmed insulin dose all at once, similar to an injection. This bolus can be helpful for foods that contain rapid-acting carbohydrates, such as cake or bread. The standard bolus is also the right bolus for correcting high blood glucose levels.

Initiating a bolus

Status screen > Bolus

Option 1:

Tap New bolus or ✛ on the Status screen.

Continue with Step 2.

Main menu > Bolus

Option 2:

Tap the Bolus menu from within the Main menu.

Continue with Step 2.

Test result > Bolus

Option 3:

After testing your blood glucose:
Tap Bolus on the Test result in detail screen.

Continue with Step 3.

> ⓘ **Note**
>
> If you have already set up the bolus advice function, tapping "Bolus", in option 3, will lead you directly to the bolus advice result screen. (For more information on bolus advice, see (Accu-Chek Solo micropump system) Chapter 9.1).

07:00

Bolus

Bolus advice

Manual bolus

Cancel bolus

Tap Manual bolus.

For instructions on delivering a bolus using bolus advice, see (Accu-Chek Solo micropump system) Chapter 9.2.

EXTENDED BOLUS

What is the extended bolus

For situations that require delivery of bolus insulin over a period of time instead of all at once, you can use an extended bolus. The extended bolus is a feature special to insulin infusion pumps where the amount of insulin is delivered over a period of time that you can adjust, as necessary. This can be especially useful for slowly digestible meals, e.g. foods with complex carbohydrates or foods that are high in fat and protein. An extended bolus can also be helpful for meals that extend over a longer period of time (e.g. a buffet). The duration of bolus delivery can be programmed in 15-minute increments for a period of up to 24 hours. Delivery begins immediately after you confirm the bolus. Throughout bolus delivery, the Status screen shows the remaining time and amount of the extended bolus. You can add a standard or quick bolus to an ongoing extended bolus and one additional extended or multiwave bolus.

ⓘ **Note**

You can only program an Extended bolus when you program insulin for carbohydrates and no insulin for corrections.

MULTIWAVE BOLUS

What is the multiwave bolus?

The multiwave bolus is another advanced feature of insulin pumps and combines a standard bolus with an extended bolus: part of the bolus amount is delivered immediately while the other part is delivered over a specified period of time. This kind of bolus can be helpful when you eat meals that contain both fast and slowly digestible carbohydrates as well as proteins and fats or long meals with several courses. You can also use this bolus type when you are planning to eat slowly digestible carbohydrates, but have an elevated blood glucose level before the meal. You then program the immediate part of the bolus for the correction of the blood glucose level and the extended part for the carbohydrates. The duration of the delayed bolus delivery can be programmed in 15-minute increments for a period of up to 24 hours, and begins immediately after you confirm the bolus. You can add a standard or quick bolus to an ongoing multiwave bolus, and one additional extended or multiwave bolus.

Status screen > Bolus

2 - - - - - - - - **TO DOSE**
press both quick bolus
buttons at once
1 press = 1 amount of
insulin increment

CONFIRMS
1 beep = 1 amount of
insulin increment - - - - - - - - **3**

4 - - - - - - **TO AGREE**
press both quick bolus
buttons again until beep
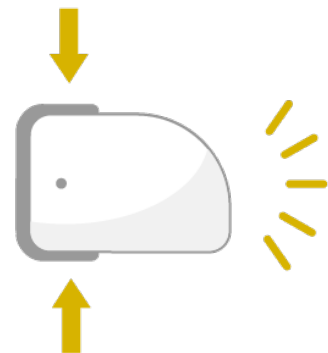

✓ **QUICK BOLUS DELIVERY STARTS**

⚠ **Warning**

Make sure that you know and use the correct quick bolus increment suitable for your personal insulin need.
Using the incorrect bolus increment will deliver a wrong insulin dose.

Using quick bolus

1. Press and hold the two quick bolus buttons for 3 seconds until you hear a beep.

2. After hearing the beep, simultaneously press both quick bolus buttons – once per increment, until the desired insulin dose has been reached.

3. 3 seconds after the last button press, the micropump will then confirm the number of button presses with one beep per press to confirm the amount of insulin entered.

4. If you agree with the amount of insulin: press both quick bolus buttons again to deliver the quick bolus. The pump will confirm the start of the bolus delivery with a sound.

CANCELLING A BOLUS

Cancelling a bolus using the "Cancel Bolus" menu

You have two options to cancel a bolus using the diabetes manager:

Facing either the status screen or the main menu, you can cancel a bolus by tapping the ⊘.

In the Cancel bolus menu, you can cancel one or all boluses.

Cancelling a bolus while programming

Standard, extended and multiwave bolus

While programming, press ⬑ to go back to the last step and enter a new value.

Quick bolus

If you have not confirmed the quick bolus by pressing both quick bolus buttons within 5 seconds, the programmed quick bolus will be cancelled.

Prevent bolus delivery without the diabetes manager

If you do not have the diabetes manager at hand and want to interrupt bolus delivery, remove the micropump from the pump holder as long as the bolus is being delivered. Then re-attach the pump into the pump holder when you are ready to continue insulin delivery. Please be aware that when the micropump has been detached from the body, no basal insulin delivery will have been received.

USING LAG TIME

What is delivery lag time?

In some situations (e.g. gastroparesis) it may be helpful to start a meal bolus after you started eating. With the delivery lag time setting, you can specify a delay between programming a bolus and the actual beginning of the bolus delivery. With lag setting switched on the delivery lag time field will appear each time you program a bolus in addition to the bolus amount and duration. You can set the lag time to 0, 15, 30, 45 or 60 minutes. Discuss using the delivery lag time setting with your healthcare professional. Before you can use this feature, you need to activate it: See (Accu-Chek Solo micropump system) Chapter 13.5, Bolus Settings.

ⓘ **Note**

Boluses containing correction insulin cannot be delayed via the lag time.
